Paragon and Isotrak continue to invest in partnership

Paragon and Isotrak have been jointly delivering systems to their customers for over 10 years and significantly launched the revolutionary TTS product in 2007 that delivers unique benefits for complex transport operations.

Isotrak and Paragon are pleased to announce the continued development of this relationship with 3 new innovations:

- 1) The development of new capability within TTS making the product even more applicable for medium and large complex multi-shifted transport operations by handling fixed route planning requirements, as well as daily planning operations.
- 2) For organisations without the need for the sophistication of TTS, Paragon are developing a new one-way interface with Isotrak's ATMS product to provide fleet management through Paragon's Fleet Controller software.
- 3) Isotrak have invested in a new shared high performance hosting platform specifically to deliver hosted Paragon and Fleet Controller in either a TTS or One-way Fleet Controller configuration. This will deliver economic deployment of scheduling and execution from a single platform.

William Salter, Paragon Managing Director: "We are serious about investing in long term relationships with our partners where we can see this providing real benefits for customers. The above developments give our customers a wider choice of Paragon/Isotrak based solutions, depending on their operational requirements and business objectives."

Greville Coe, Strategic Partner Director: "With our partners Paragon, we continue to develop market leading solutions that provide competitive advantage to our customers. We look forward to many more years of fruitful collaboration with Paragon".
